Debugging Log

Logged a total of **0.7 hours** of debugging.

Entry 1

22 minutes spent debugging

Failure

After selecting my 2 locations, I run into a runtime error which is not what I want since I am expecting a pa

Experiments

Experiment 1.1

Question: Is my fetch request working properly?

Steps Taken: I ran a console.log inside my doEndPointChange and I console.error in my handleFetchErr

Result: The url printed out just fine and there was no error

Lesson: I learned that my fetch request was working properly

Experiment 1.2

Question: Is my server correctly returning the path?

Steps Taken: I console.log the data inside my handlePathData helper method

Result: I found out that is indeed the correct type is an array

Lesson: something else in my server is incorrectly returning the data

Defect

```
res.send({path: thePath});
```

I was suppose to send over an array and thePath is an object which caused my path to not compile

Debugging Scope

This failure **was** in the same function as the bug. To find the bug, I debugged through the following functi

```
server/src/routes.ts thePath
```

Entry 2

14 minutes spent debugging

Failure

The names that I have for my endpoints dont match what my server should be getting.

Experiments

Experiment 2.1

Question: Is the server able to get the parameters that I send over?

Steps Taken: I console.log my req.queury to see if my req recieves anything, which I expect a string for

Result: my start and end both hold onto strings, so the server is able to get something

Lesson: That my server is able to get access to my parameters but its not collecting correctly.

Defect

```
fetch(`/api/shortestPath?start=${from.longName}&end=${to.longName}`)
```

my parameters called start and end are never recognized because I mixed up my variable names

Debugging Scope

This failure **was** in the same function as the bug. To find the bug, I debugged through the following functi

```
client/src.App.tsx doEndPointChange
```

Entry 3

10 minutes spent debugging

Failure

I see the path, but the building names don't match. I see that the dropdown selections don’t trigger the fe

Experiments

Experiment 3.1

Question: Do I have acccess to my variables and are they getting any value passed

Steps Taken: Inside my editor, I console.log my fromBuilding and toBuilding variable in my handleLoca

Result: I see one of my console log tests came out as Select a location but it shouldnt be that

Lesson: Something containing that phrase needs to be look at.

Defect

```
<option>Select a location</option>
```

I incorrectly implemented my options and it led to building names being returned as undefined.

Debugging Scope

This failure **was** in the same function as the bug. To find the bug, I debugged through the following functi

```
client/src/Editor.tsx render
```
